Web Site Development Pro

1. Analysis

- As a part of a system how the web site or the web based application is going to help the present system and
- how the site is going to help the business.
- should cover all the aspects especially on how the web site is going to join the existing system.
- The first important thing is finding the targeted audience.
- All the present hardware, software, people and data should be considered during the time of analysis.

Analysis

- The analysis should be done in the way, that it may not be
  - too time consuming or
  - with very less informative.
- The team should come up with the complete cost- benefit analysis
- A realistic plan for the project will be an output of analysis,
- the analyst should consult the
  - designers,
  - developers and
  - testers to come up with a realistic plan.
- **Input:** Interviews with the clients, Mails and supporting docs by the client, Discussions Notes, Online chat, recorded telephone conversations,Model sites/applications etc.,

- **Output:** 1. Work plan, 2. Cost involved, 3. Team requirements, 4. Hardware-software requirements, 5. Supporting documents and 6. the approval.

2. Specification Building:

- Preliminary specifications are drawn up by covering up each and every element of the requirement.
- Larger projects will require further levels of consultation to assess additional business and technical requirements.
- After reviewing and approving the preliminary document, a written proposal is prepared, outlining the scope of the project including
  - responsibilities
  - timelines and
  - costs.
- **Input:** Reports from the analysis team.
- **Output:** Complete requirement specifications to the individuals and the customer/customer's representative.

3. Design and development:

- work on the web site is scheduled upon receipt of the signed proposal and any written content materials and graphics you wish to include.
- customer may be interested in viewing two or three design with all images and navigation.
- all the changes should be freezed before moving into the next phase.
- As needed, customer comments, feedback and approvals can be communicated
- Throughout the design phase the team should
  - develop test plans and
  - procedures for quality assurance.

3. Design and development:

- It is necessary to obtain client approval on design and project plans.
- In parallel, the Database team will sit and understand the requirements and develop the database with all the data structures and sample data will also be prepared.

- **Input:** Requirement specification.
  Output: Site design with templates, Images and prototype.

4. Content writing

- necessary mainly for the web sites.
- There are professional content developers who can write industry specific and relevant content for the site.
- Content writers to add their text can utilize the design templates.
- The grammatical and spelling check should be over in this phase.
- Input: Designed template.
  Output: Site with formatted content.

5. Coding

- Now its programmers turn to add his code without disturbing the design.
- the developer should understand the design and navigation.
- If the site is dynamic then the code should utilize the template.
- The developer may need to interact with the designer, in order to understand the design.
- If a team of developers is working they should use a **version control system** to control their sources.
- Coding team should generate necessary
  - testing plans as well as
  - technical documentation.
- The end-user documentation can also be prepared by the coding team, which can be used by a technical writer who can understand them, write helps and manuals later.
- **Input:** The site with forms and the requirement specification. **Output :** Database driven functions with the site, Coding documents.

6. Testing:

- need intensive testing, as the applications will always function as a multi-user system with bandwidth limitations.
- Some of the testing which should be done are,
  - Integration testing,
  - Stress/ Scalability testing,
  - resolution testing and
  - cross-browser compatibility testing.
- Both automated testing and manual testing should be done
- live testing is necessary for web sites and web based applications.
- After uploading the site there should be a complete testing (E.g.. Links test)
- **Input:** The site, Requirement specifications, supporting documents, technical specifications and technical documents. **Output:** Completed application/site, testing reports, error logs, frequent interaction with the developers and designers.

7. Promotion

- Promotion needs
  - preparation of meta tags,
  - constant analysis and submitting the URL to the search engines and directories.
- The site promotion is normally an ongoing process as the strategies of search engine may change quite often.
- **Input:** Site with content, Client mails mentioning the competitors.
  Output: Site submission with necessary meta tag preparation.

8. Maintenance and Updating:

- need quite frequent updating to keep them very fresh.
- In that case we need to do analysis again, and all the other life cycle steps will repeat.
- Bug fixes can be done during the time of maintenance.
- Once your web site is operational,
  - ongoing promotion,
  - technical maintenance,
  - content management & updating,
  - site visit activity reports,
  - staff training

  is needed on a regular basis depend on the complexity of the web site and the needs within the organization.
- **Input:** Site/Application, content/functions to be updated, re-analysis reports.
  Output: Updated application, supporting documents to other life cycle steps and teams.
