Ans:no:01

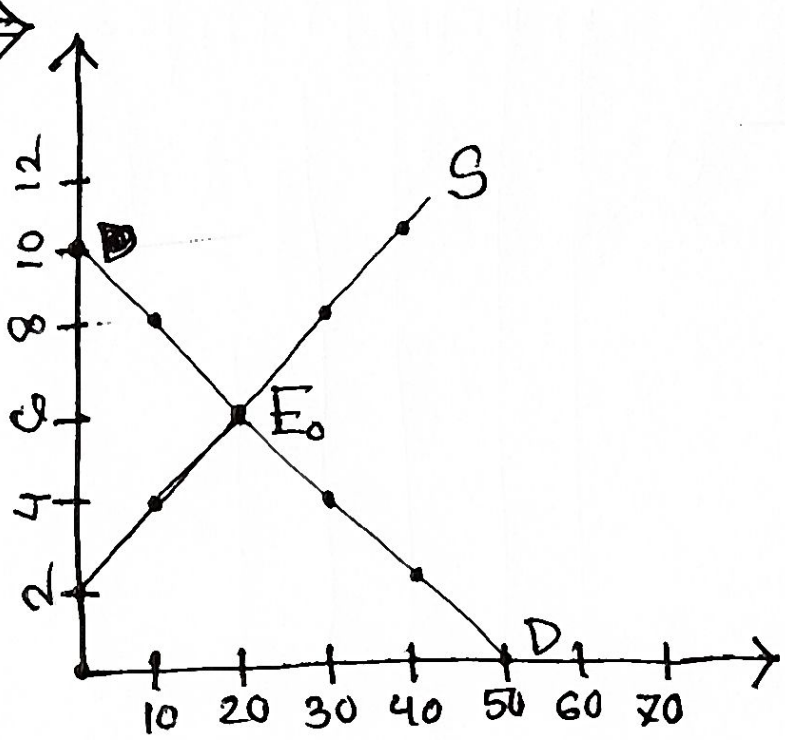

(a) ⇒ Demand ~~Supply~~ curve,

supply curve,

(b) ⇒

∴ Equilibrium Price, = $6

∴ Equilibrium Quanity = 20

(c) ⇒ For quanitity demand,

~~0+10+20+30+40+50 = 25~~ a = 50

$$b = \frac{10+8+6+4+2+0}{6} = 5$$

∴ $Q_d = 50 - 5P$ ——— (1)

For quantity of supply,

$-c = 10$

$d = b = 5$

$\therefore Q_s = -10 + 5P$ ——— (11)

we know,

in the equilibrium condition,

$Q_d = Q_s$

$\Rightarrow 50 - 5P = -10 + 5P$

$\Rightarrow 5P + 5P = 50 + 10$

$\Rightarrow 10P = 60$

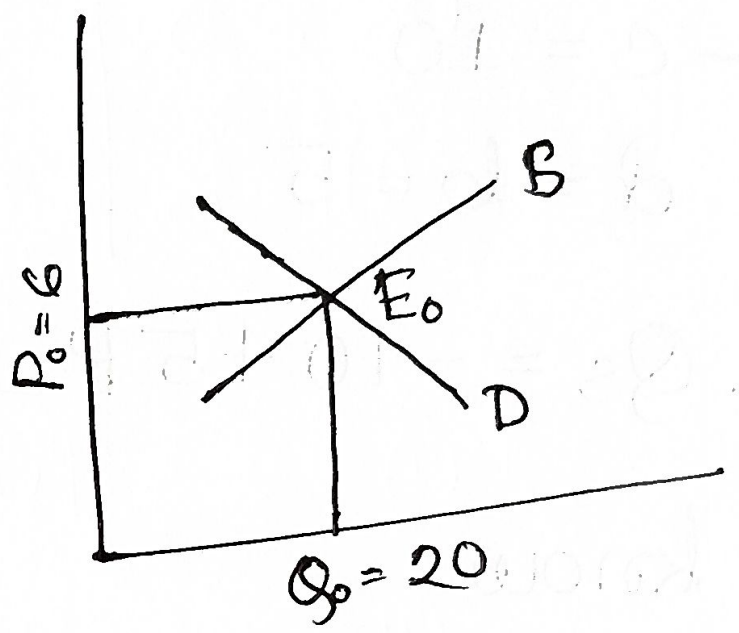

$\therefore P = 6$

putting $P = 6$ in equation (1), we get,

$Q_d = 50 - 5 * 6$

$= 20$

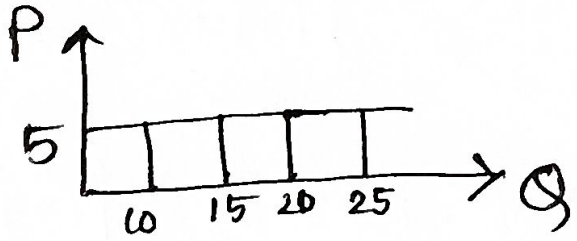

So equilibrim price, P = 6 and quantity, Q = 20

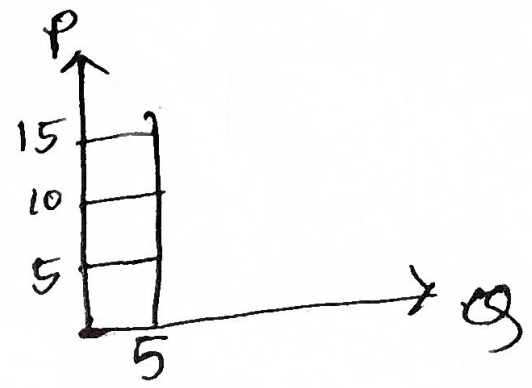

Ans: no: 04

(a) ⇒

(a) → intinite demand ($E_d = \infty$),

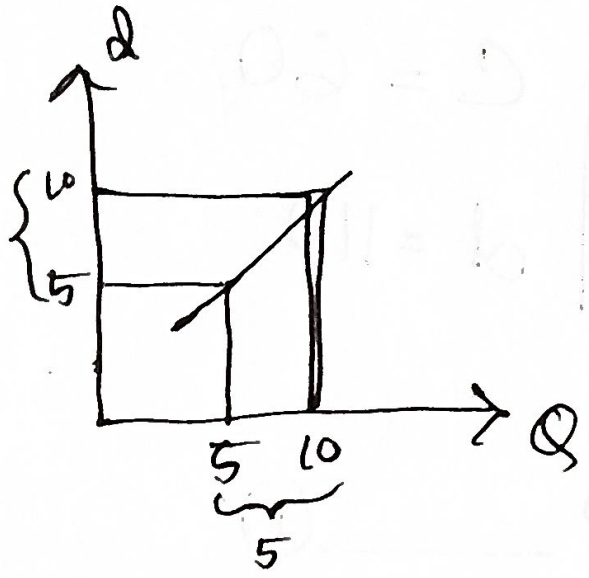

(b) → Zero demand ($E_d = 0$),

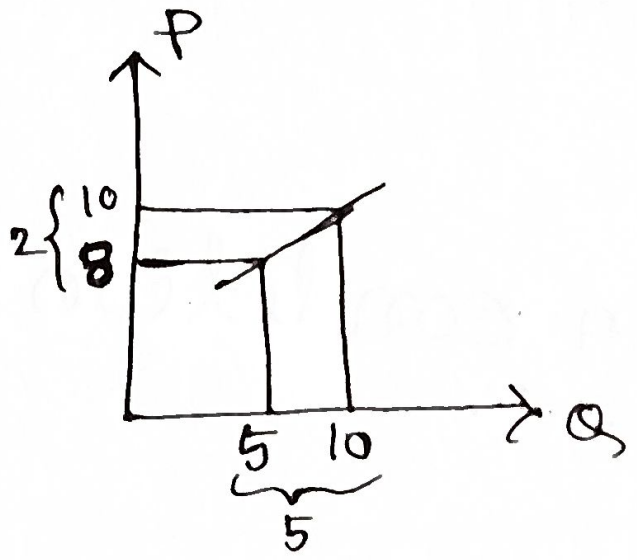

Healthcare

ⓒ → ~~unit~~ unity demand ($E_d = 1$)

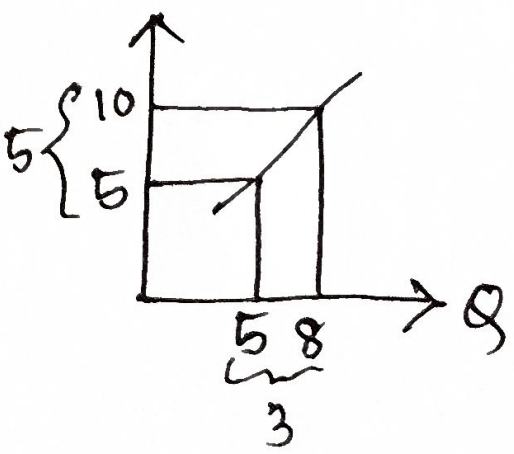

ⓓ → elastic demand ($E_d > 1$),

$$\frac{5}{2} \times \frac{8}{5} = 4 > 1$$

ⓔ → inelastic demand ($E_d < 1$),

$$\frac{3}{5} \times \frac{5}{5} = 0.6 < 1$$

TOLUS

(b) ⇒ Given that,

$a = 220$ | $c = 60$

$b = 90$ | $d = 110$

$\therefore Q_d = 220 - 90P$ ——— (I)

$\therefore Q_s = -60 + 110P$ ——— (II)

we know,

in equilibrium condition,

$Q_d = Q_s$

$\Rightarrow 220 - 90P = -60 + 110P$

$\Rightarrow 110P + 90P = 220 + 60$

$\Rightarrow 200P = 280$

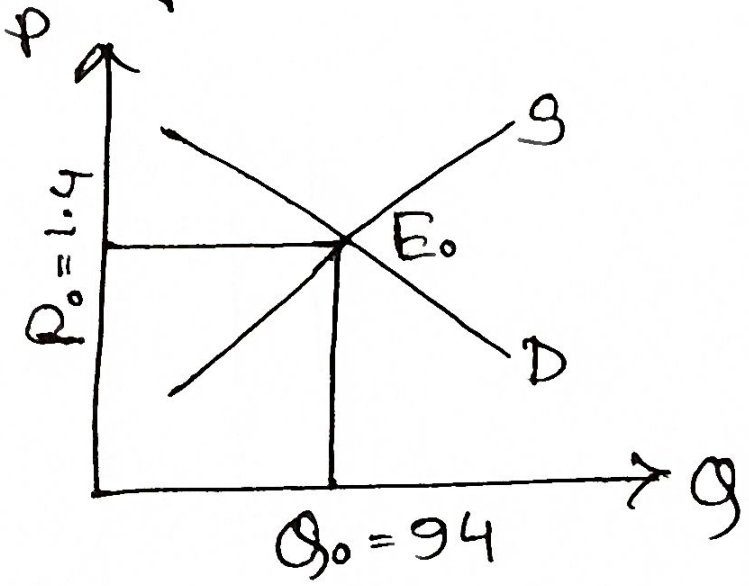

$\therefore P = 1.4$

putting $P = 1.4$ in eqn (1), we get,

$$Q_d = 220 - 90 * 1.4$$

$$= 94$$

So, equilibrium price, $P = \$1.4$ and Quantity, $Q = 94$.
